1

CONTEXT

Poverty, energy, and
agriculture dynamics in
Sub-Saharan Africa

The majority of the world's poor lives in rural sub-Saharan Africa

56% of the people currently living in extreme poverty are in Sub-Saharan Africa

70% of the world's poor population live in rural Africa

~90% extremely poor people will live in Sub-Saharan Africa, by 2030

People in extreme poverty (millions)

55% of households in sub-Saharan Africa lack electricity access

Number of people without access to electricity, 2016

Our World
In Data

Source: OWID based on World Bank, Sustainable Energy for All (SE4ALL) and UNWFP
OurWorldInData.org/energy-production-and-changing-energy-sources • CC BY

In 2019

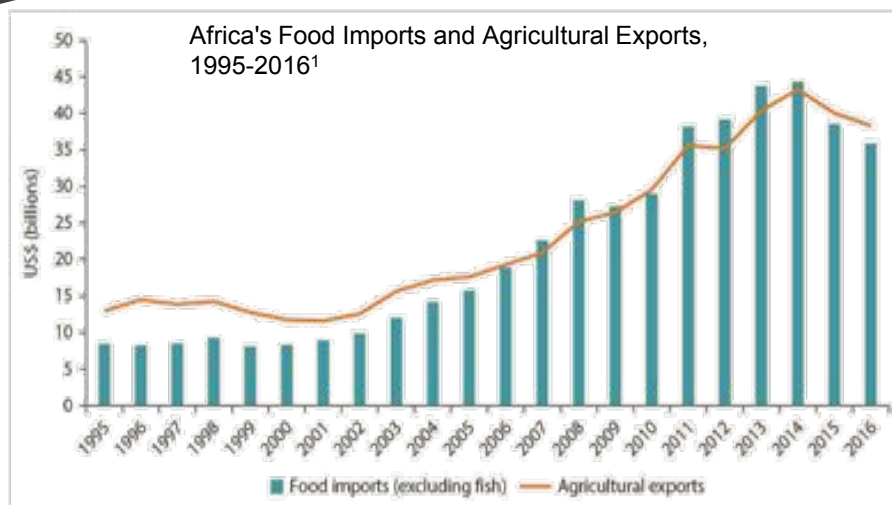

An estimated **573 million people** in **Sub-Saharan Africa** lack access to electricity

In 2030

Without dramatic changes in energy access, **600 million people** in **Africa** will lack access to electricity

Africa imports USD 50 billion of food each year

The food import bill for sub-Saharan Africa is expected to be **USD 48.7 billion in 2019**, up 3.8% from USD 46.9 billion in 2018⁵

Food imports in Africa are expected to grow to over **USD 110 billion by 2025**⁶

Top 10 imported food commodities in Africa in 2017

Consumer demand for food products in Africa will exceed **USD 700 billion by 2030**

Crop yields in Africa are a fraction of global averages

Cereal* yield (kg per hectare) in 2017¹

Cereal* production (metric tons) - Sub-Saharan Africa, OECD members, World¹

Africa has more than 50% of the world's fertile and unused arable land

Average fertilizer use in Africa is 17kg per hectare of arable land, compared with a global average of 135 kg

Agricultural yields are 56% of the international average

Note:

*Cereal includes wheat, rice, maize, barley, oats, rye, millet, sorghum, buckwheat, and mixed grains

³ Abebe Shimeles, Audrey Verdier-Chouchane, Amadou Boly, Introduction: Understanding the Challenges of the Agricultural Sector in Sub-Saharan Africa, 2018, p1

These challenges are seen throughout sub-Saharan Africa

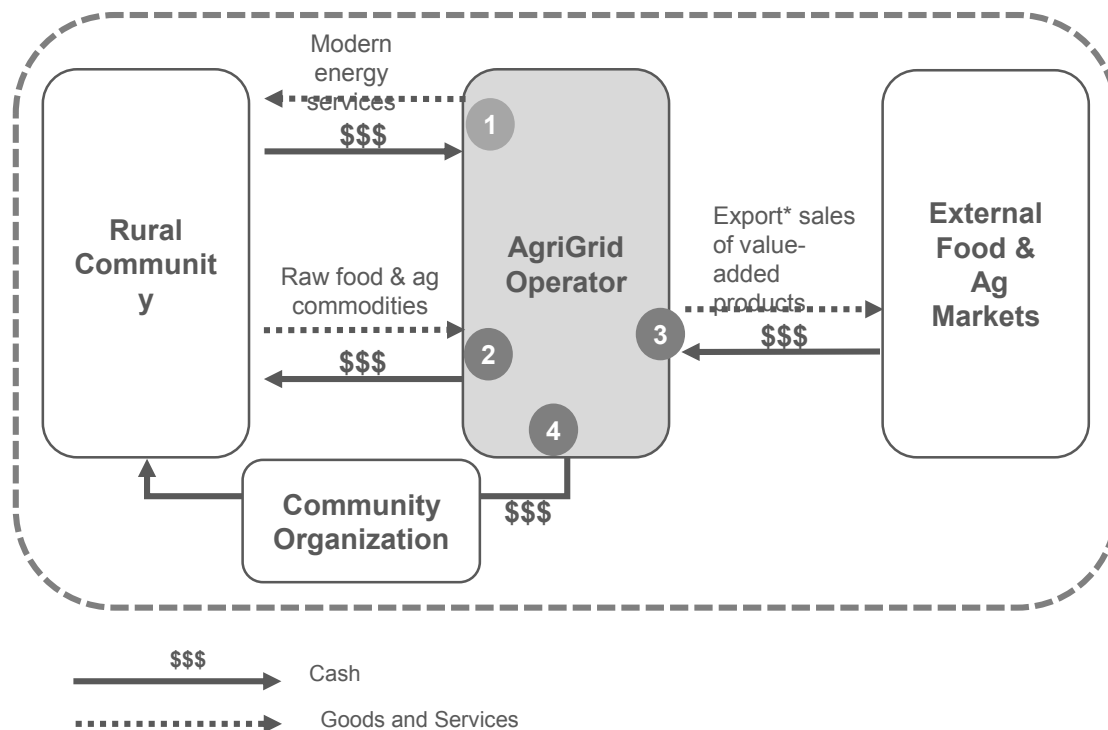

A woman with her hair in a bun, wearing a black and white patterned dress, is holding a small brown chicken. The background is a soft-focus outdoor scene with green foliage. The image is partially covered by a large orange triangle in the top left and a dark grey triangle in the bottom left, which contains the text.

2

INTRODUCING AGRIGRID

A business model concept
integrating agribusiness with
mini-grid electrification

AgriGrid businesses export* value-added products to external markets while also selling modern energy services

1

AgriGrid Operator installs and operates mini-grid and sells energy services to community.

2

AgriGrid Operator develops and agricultural strategy, and purchases raw food & ag products from community.

3

AgriGrid Operator refines raw food & ag products and sells value-added food & ag products to external markets.

4

AgriGrid Operator and Community Organization manage a profit-sharing arrangement with the community.

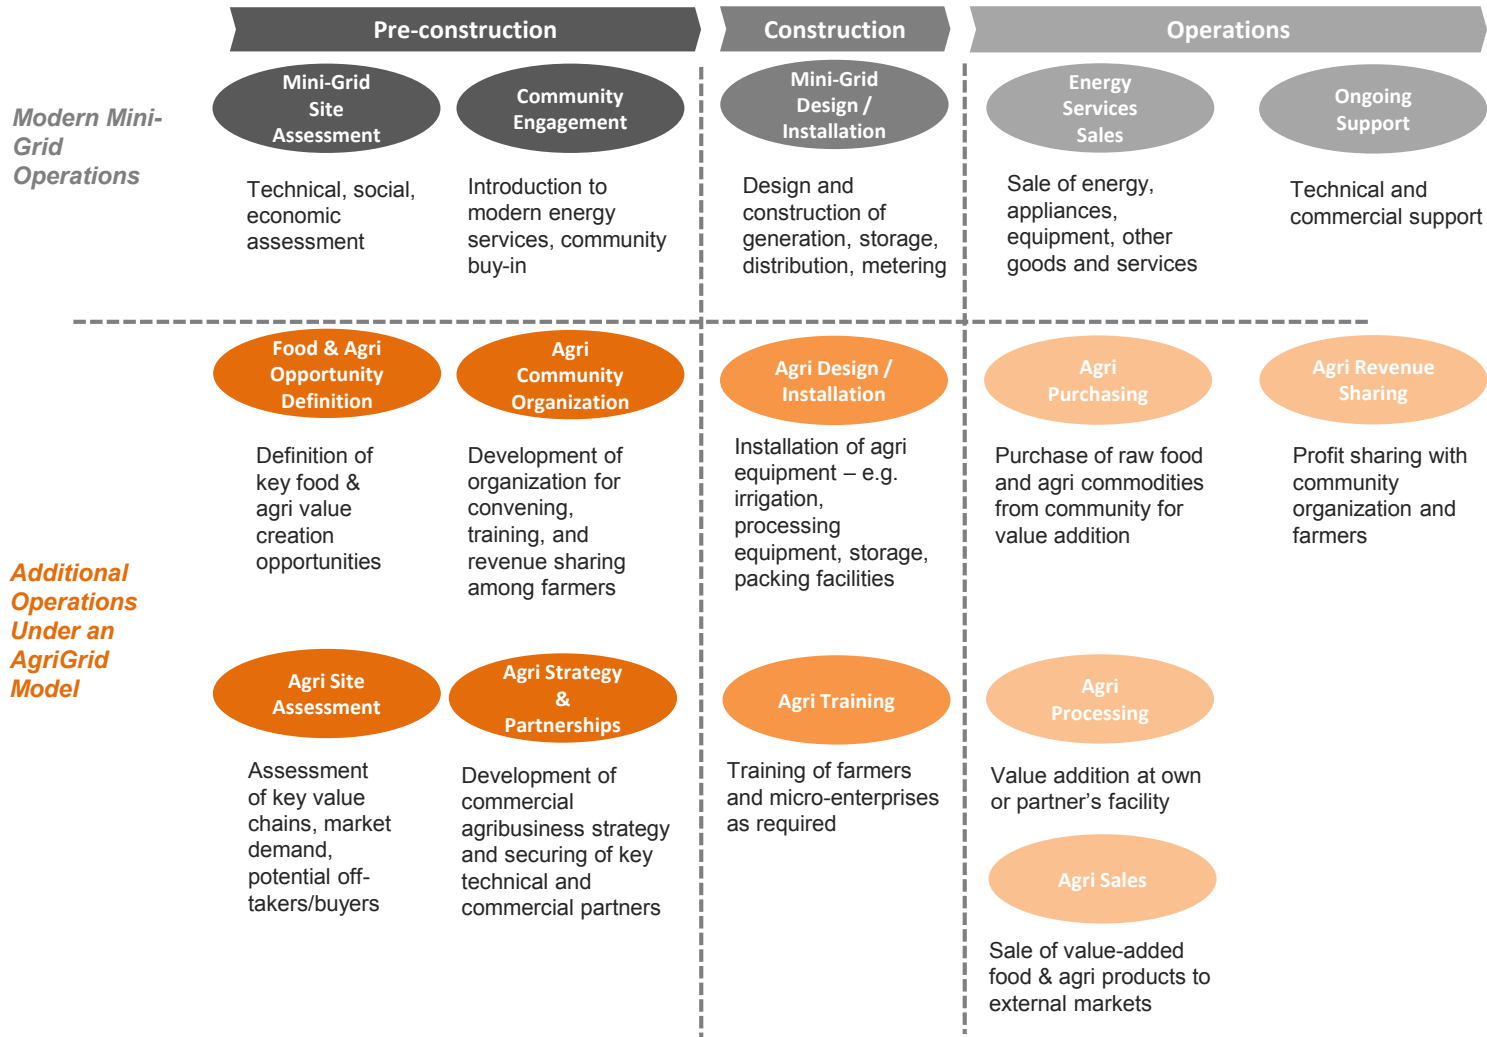

* "Export" refers to the sale of commodities produced in rural communities to any external market, including domestic urban markets.

Several levers are used to create economic value and increase export revenue in electrified villages

- 1** Increased crop yield, diversity, intensity
- 2** Extra harvest season for income smoothing
- 3** Production of modern, commercial grade food and agricultural products
- 4** Reduction in losses, pricing power, access to new markets
- 5** Reduction in losses, entrance to formal sector, access to new markets
- 6** Reduction in losses, entrance to formal sector, access to new markets
- 7** Institutional infrastructure for convening, training, revenue sharing
- 8** Business analytics for decisions, optimization, reporting
- 9** Agricultural sales, technical partners, marketing, capital, legitimacy

A set of food and agricultural operations are added to the mini-grid development lifecycle

3

WHY AGRIGRID?

Targeting rural prosperity
and strengthening mini-grid
business models

Food and agriculture is a major potential source of wealth creation for rural areas

60% of arable land is in Africa¹

Only 4% of arable land in Sub-Saharan Africa is irrigated²

Average fertilizer use in Africa is 17kg per hectare of arable land, compared with a global average of 135kg³

Agribusiness in Africa is a \$1 trillion opportunity⁴

4 <https://www.afdb.org/en/news-and-events/africa-agribusiness-a-us-1-trillion-business-by-2030-18678>

Rural communities in Africa are often marginalized and excluded from agricultural wealth

	Rural Areas	Domestic Food and Agriculture Networks	Urban Areas
Characteristics	<ul style="list-style-type: none">• Low income, agrarian communities• Limited access to information and knowledge of best practices• Limited access to inputs• Limited access to finance• Limited access to markets• Off-grid with limited infrastructure	<ul style="list-style-type: none">• Strong presence of informal, opportunistic and exploitative operators• Inefficient operations with limited incentive to modernize or optimize• Often simple and low CAPEX trading businesses	<ul style="list-style-type: none">• Expanding populations• Emerging, aspirational middle class• Increasing purchasing power• Increasing demand for quality food and beverages
Status quo	At the mercy of informal traders and middlemen	Inefficient systems with unrealized technical potential and large losses	Growing demand met by cost competitive food imports
Long-term outlook	Likely to remain economically disenfranchised and fragile without enhanced farmer protection	Likely to remain fragmented without major investments by formal actors	Likely to continue to favor imports over costly or low quality domestic products

Mini-grids are an important electrification solution for rural Africa but can be challenging investments

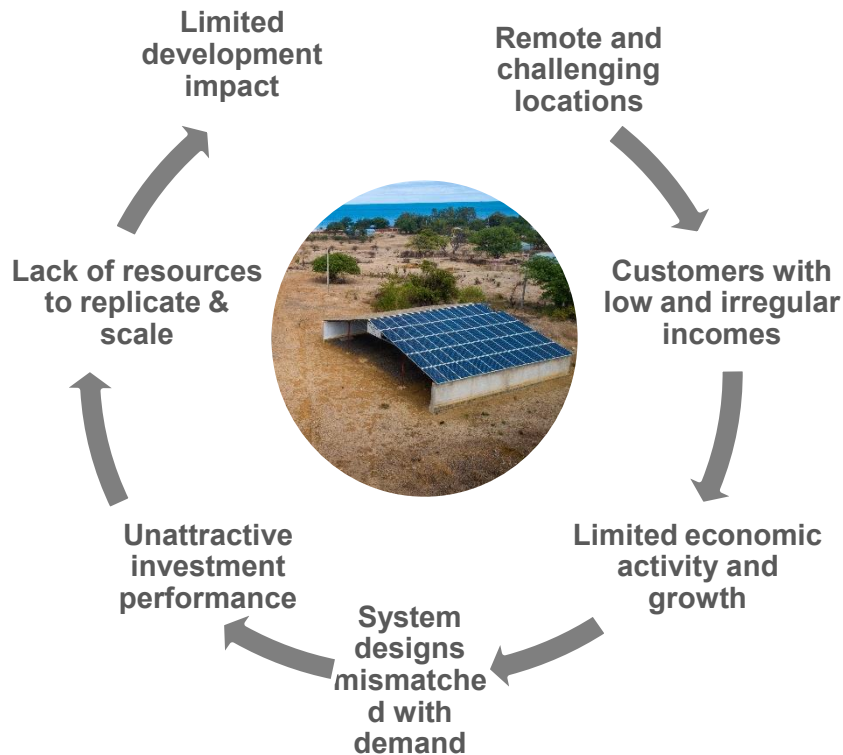

Source: CrossBoundary Energy Access

Modern Mini-Grid Investments in Africa

- High Average Investment Per User
- Low Average Revenue Per User
- Uncertainty in load and revenue forecasting
- Limited economic activity precludes demand growth
- OPEX floor reduces site profitability
- Uncertain interactions with utilities and national planning
- Uncertain and dynamic regulatory environments
- Dynamic subsidy and capital environments
- High WACC reflecting several sources of investment risk

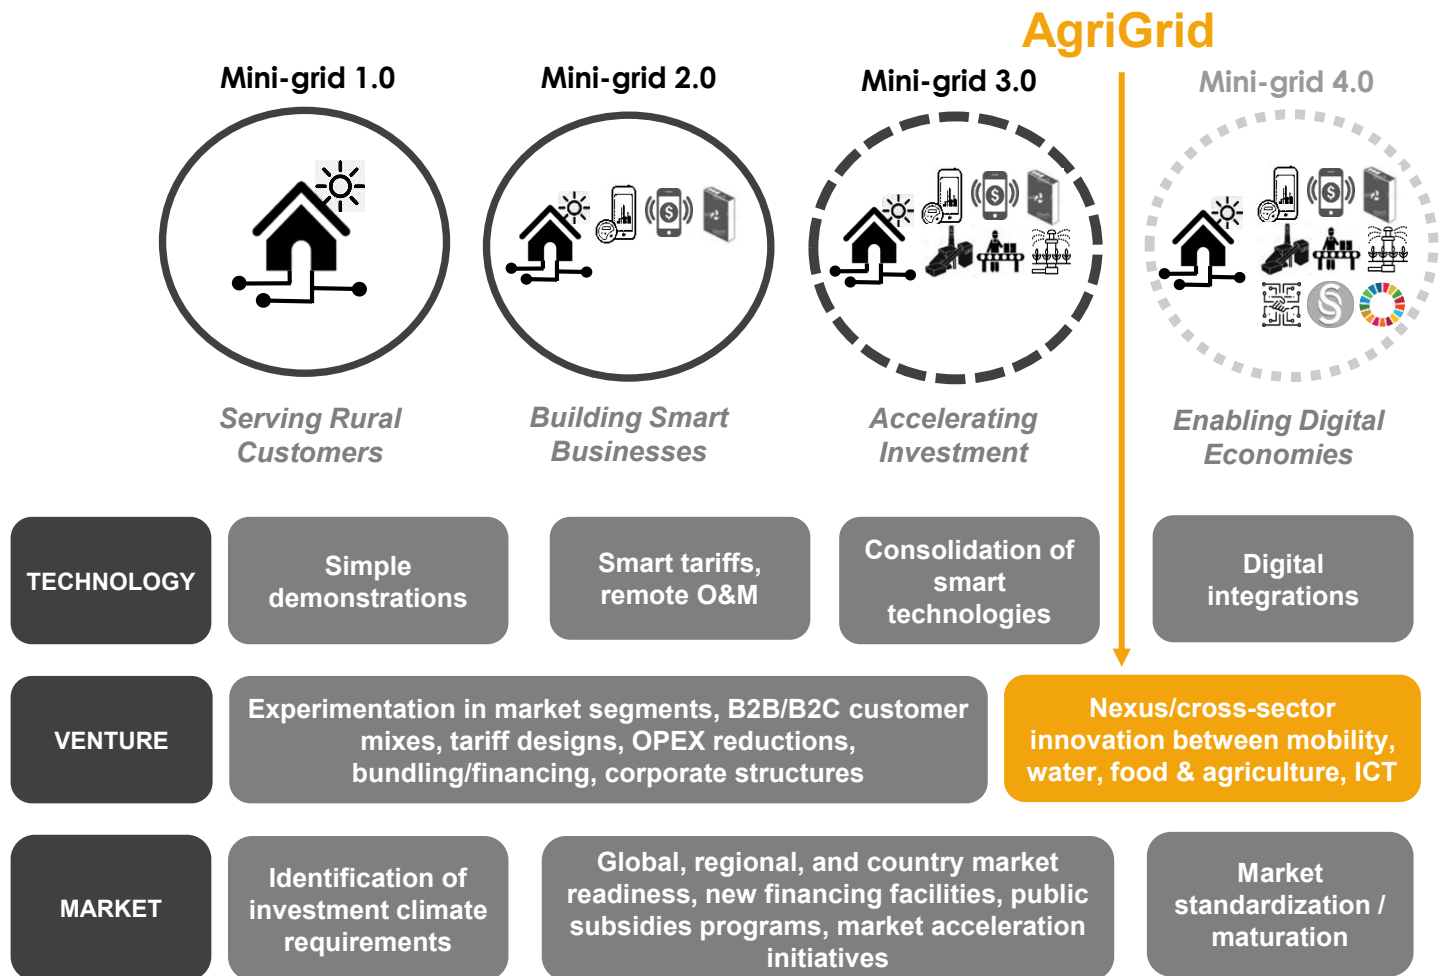

Site-level difficulties have limited* the scaling and impact of mini-grids in Africa to date

- Mini-grids are deployed in low-income communities with irregular cashflows
- The sizing of generation and storage is challenging due to seasonality and uncertainty in load forecasting
- Tariff designs require experimentation to test acceptance with price-sensitive communities
- Long-term growth in energy demand is difficult to forecast and rarely matches estimates
- Site-level investment performance remains poor, making it difficult for developers to access additional resources to scale

*Note: The scope of this note is limited to site-level economics. It does not discuss broader but also critical challenges affecting mini-grids such as: licensing, regulation, financing/subsidies, and other aspects of the investment climate.

Fortunately, standardization is enabling commercial experimentation: “Mini-Grids 3.0” and beyond

Mini-grid companies bring valuable resources and capabilities that can be leveraged to ease constraints in agribusiness

Relevant strengths of mini-grid companies

Commercial and technical expertise

National and international recognition

Visibility and credibility

Business networks and partners

Smart technologies

Ability and ambition to operate at scale

Formal business practices

Social impact-orientation

African agricultural commodity value chains face common constraints¹

Under-Performing Value chains	Insufficient utilization of inputs and mechanization	Limited reach of to boost on farm production	Poorly organized post aggregation and transport	Inconsistent capacity for effective value addition	Poorly developed market linkages trade corridors
Insufficient Infrastructure	Insufficient transport, energy, water and others hard infrastructure leading to uncompetitive cost structures		Underdeveloped soft infrastructure aging smallholder farmers and lack skills commercial agriculture and agro-allied industries		
Limited to agriculture finance	Real and perceived risk limiting private sector investment	High service cost due to small deal sizes, lack of data, and low capacity in agriculture lending		Limited market attractiveness relative to perceived higher returns outside of the agriculture sector

Mini-grid companies bring valuable resources and capabilities that can be leveraged to ease constraints in agribusiness

Relevant strengths of mini-grid companies

Commercial and technical expertise

National and international recognition

Visibility and credibility

Business networks and partners

Smart technologies

Ability and ambition to operate at scale

Formal business practices

Social impact-orientation

African agricultural commodity value chains face common constraints¹

Adverse agri-business environment	Unfavorable access and incentives limiting trade and capacity to produce high-quality products	Ineffective sector regulation creating long lead times for new technologies inconsistent trade policies	Unsupportive business enabling environment restricting land tenure and general ease of doing business
Limited inclusivity, sustainability and nutrition	Insufficient inclusivity of women and youth in agriculture development	Limited incentives to ensure sustainability and climate-resilient practices.	Limited access and affordability of commodities with high nutrition levels

Mini-grid companies navigate several unknowns when identifying, assessing, and designing new sites

Who to connect to the grid?

- What mix of anchor, institutional, micro-enterprise, and household customers to connect?
- Who is too far from the mini-grid?
- Who is best served by an SHS?

How to design tariffs and forecast long-term pricing?

- How to design a tariff structure for differing customer segments?
- How will communities and customer behavior change once over time?
- How will communities react to tariff changes?

How to manage seasonality?

- How can we increase demand for electricity over the long-term?
- How can we manage low consumption during low-income seasons?
- How can we smooth Abilities to Pay (ATP) and/or energy consumption throughout the year?

How to size and time CAPEX?

- How much generation and storage capacity to install?
- How much capacity to install now vs. later?
- How to ensure that electrical equipment and appliances are available in the community?

By creating rural wealth, AgriGrid operators mitigate key mini-grid investment risks

Who to connect to the grid?

- By providing access to market for agricultural commodities, a greater number of households will be able to afford connection fees and electricity purchases.
- Some households will remain untenable for mini-grid connection due to their location.

How to design tariffs and forecast long-term pricing?

- Greater disposable income provides certainty around increased household demand for electricity.
- Commercial loads from agricultural infrastructure can be accurately forecasted during business planning.
- The existence of a community organization that is connected to agriculture and energy operations can mitigate social risks.

How to manage seasonality?

- Greater income increases household resilience and the ability to save during low-income seasons.
- AgriGrid operations can be designed with multiple food & ag value chains to smooth incomes and load year-round.

How to size and time CAPEX?

- Increased incomes enables greater certainty in ability to pay for electricity.
- Installing a large commercial processing facility to support a viable agribusiness decreases error margins in capacity planning.
- Providing market linkages ensures that equipment and appliances are paid off.

The model alleviates challenges in crop productivity, rural incomes, energy access, and food systems

Modern Mini-Grid

- Low agricultural productivity
- Low and irregular household incomes
- Limited ATP* for energy services
- Limited growth in energy demand
- Economically fragile communities
- Financially fragile mini-grid companies

- Informal, exploitative, inefficient agribusiness industry

- Unmet consumer demand for food
- Net food importer
- Government food subsidies

AgriGrid

- Optimized agricultural productivity
- Increased and smoothened incomes
- Greater disposable income for energy consumption
- Economically growing communities
- Financially valuable agribusiness companies

- Modern, efficient, and commercial-scale agribusiness

- Consumption of domestic products
- Net food exporter
- Government FX revenue

While the AgriGrid model may create long-term value, operational risks also increase

STRENGTHS

- Increased household incomes in rural areas
- Increased household energy consumption
- Improved load forecasting
- Decreased effects of seasonality
- Increased development impact
- Improved investment performance
- Greater trust with communities
- Increased national economic benefits

WEAKNESSES

- Need for agribusiness and mini-grid expertise
- Increased CAPEX and OPEX requirement
- Complex, site-specific project designs and models
- Multi-party/partner commercial risks
- New regulatory risks (food and agriculture)
- Inter-/intra-company tradeoffs

OPPORTUNITIES

- High value international export opportunities
- Multi-value chain product strategies
- More attractive financing terms and envelopes
- Transformation of local communities
- Creation of industrial clusters
- Integration with national energy, food, and agro-industrial investment planning
- Leveraging food, agriculture, and nutrition resources for energy access aims

THREATS

- Competitive pressures in food and ag markets
- Dependency on seasonal commodities
- Climate risks: floods, pests, crop disease, drought
- Pricing risks of agricultural commodities
- Community risks of profit sharing models
- Risk of disenfranchising existing traders
- Challenging to secure partners due to complexity

Site Selection: 3 sites shortlisted sites for Rapid Scans

Rice Value chain in Madagascar

- For each of the 3 shortlisted sites, our field team gathered data on existing food & agriculture activities
- We coupled this data with pre-existing site feasibility assessments
- We looked at other generic factors - such as road access, presence of commercial ag players, proximity to demand centers, and more – to select the site for a deeper dive

Site Selection: “MadaSite”

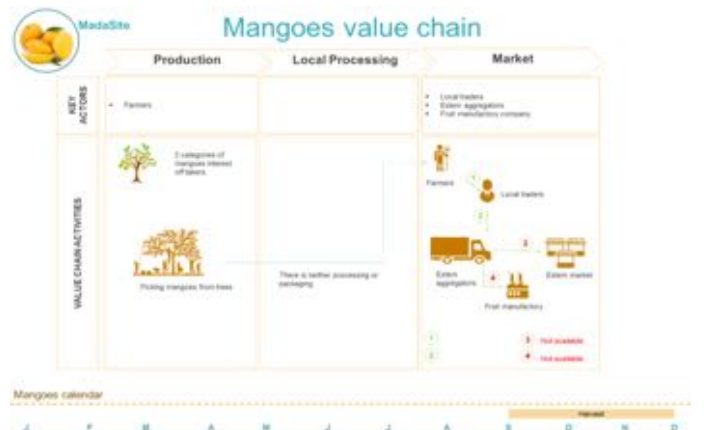

General Site Information

-  **1262** Households  **12** km from paved road
-  **05** Schools
-  **06** Churches  • Closest town: 13 km
-  **02** Clinics • Head of region: 145 km
-  **15** Rice huskers  Daily bus and rickshaws to closest town
-  **Poor** network coverage  Nearest grid: 13 km

Mini-Grid Specifications

- 195 kW Solar PV
- 110 kVA Diesel
- 252 kWh Li-ion storage
- 14,5 km LV network
- 800 connections
- 780 1-Phase connections
- 20 3-Phase connections

Agricultural Information

Base Case: A modern mini-grid at MadaSite

A 192 kWp Solar PV/Diesel hybrid project at MadaSite performs as a conventional modern mini-grid

Customers

Number of phase 1 users	#	983
Number of phase 3 users	#	12

Total Generation Assets

Solar PV incl. mounting system	kWp	192
Diesel generators	kVA	140
Battery	kWh	252
PV inverter	kVA	170

Total Distribution Assets

LV distribution grid	km	14,2
MV distribution grid	km	–

Forecast period	years	25
-----------------	-------	----

Equity

		agri-grid
Equity IRR (US\$ based)	%	17,33%
Project IRR (MGA based)	%	19,5%
Project NPV	USD	227.086
Payback (yrs)	years	10

*Capital structure = 55% grant, 15% equity, 30% debt; equity IRR = 12%, WACC = 12.5%.

The main and existing agricultural value chains include rice, tomato, banana, mango, and sugarcane.

	Market potential	Social impact	Scale and replicability	Seasonality
Rice	• • •	• • •	• • •	• •
Banana	• •	• • •	• • •	• •
Sugar cane	• •	• •	• •	•
Tomato	• •	•	• •	•
Mango	• •	• •	•	•

High potential

- 90% of farmers in the village grow rice
- There are 2 harvest seasons, smoothing incomes
- Rice is the main staple crop in the country, so the opportunity is highly scalable to other sites
- Rice millers want electricity to replace diesel

- Many other sites have high banana production
- Bananas can be processed into juice or dried fruits
- Bananas grow almost year-round

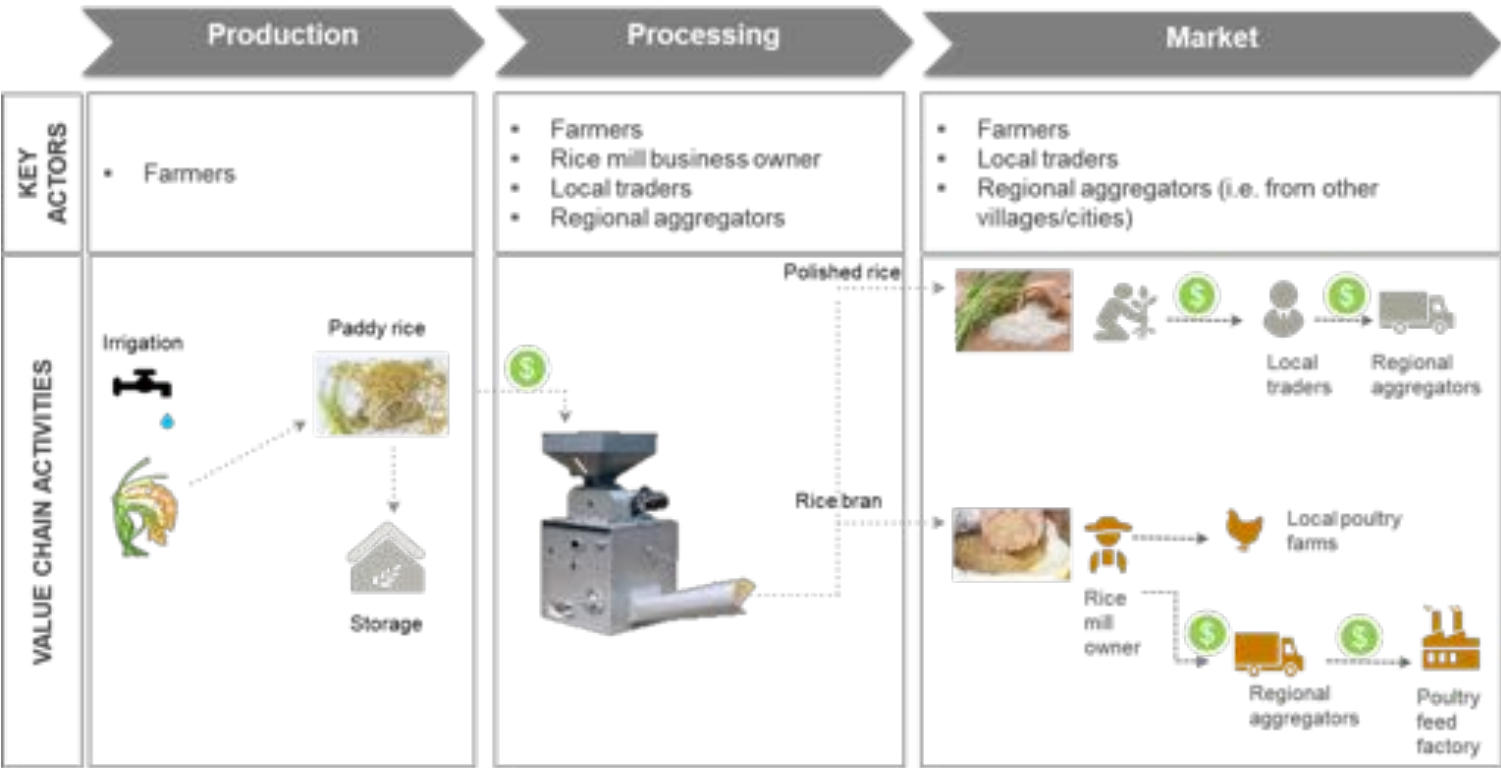

- There is a sugar company near the site
- Around 50% of the farmers grow sugarcane
- Few areas in the country produce sugarcane

Result:

We selected the rice value chain as the lead value creating opportunity in MadaSite. Rice is grown throughout the country however there is minimal value addition in rice value chains. Madagascar imports USD 118 million of cooking oil, for which domestically produced **Rice Bran Oil (RBO)** can be a competitive substitute.

AgriGrid case: Food & ag analysis at MadaSite

AgriGrid Case: Producing RBO at MadaSite on a rather small scale with max. 20 MT per day during high season

Number of local rice huskers	#	29
Average rice bran processed during HIGH SEASON per husker	MT p.m.	20,0
Average rice bran processed during LOW SEASON per husker	MT p.m.	7,0
Average volume of rice bran per husker	MT p.a.	123,0
TOTAL rice bran production	MT p.a.	3567,0
Purchasing price from rice dehuskers	MGA/MT	300.000
Rice husker inclusion rate	%	
Total annual rice bran yield	MT p.a.	
Losses and wastage	%	10,0%
Net annual production volume	MT p.a.	
Rice bran oil content	%	20,0%
Rice bran oil volume p.a.	MT p.a.	642,1

Annual sales of more than 1 billion MGA p.a. both to local shops and to wholesalers (equivalent to USD 280k)

Market

- Households would adopt RBO at a competitive price
- Household cooking oil consumption of 2 liters/month
- Sales territories and the storage facility sized such that RBO sales were possible year-round

Business Design

- Mini-grid and RBO investments are shared by one entity
- O&M of mini-grid and RBO assets provided by one entity
- Rice bran catchment area limited to electrified mills (29)
- RBO factory receives free electricity (i.e. self-consumption)
- RBO sold to retailers *outside of MadaSite*
- RBO profits are shared 50/50 with community association
- Community association allocates RBO profit share in cash (i.e. not in-kind)
- Households maintain % energy expenditure

Energy

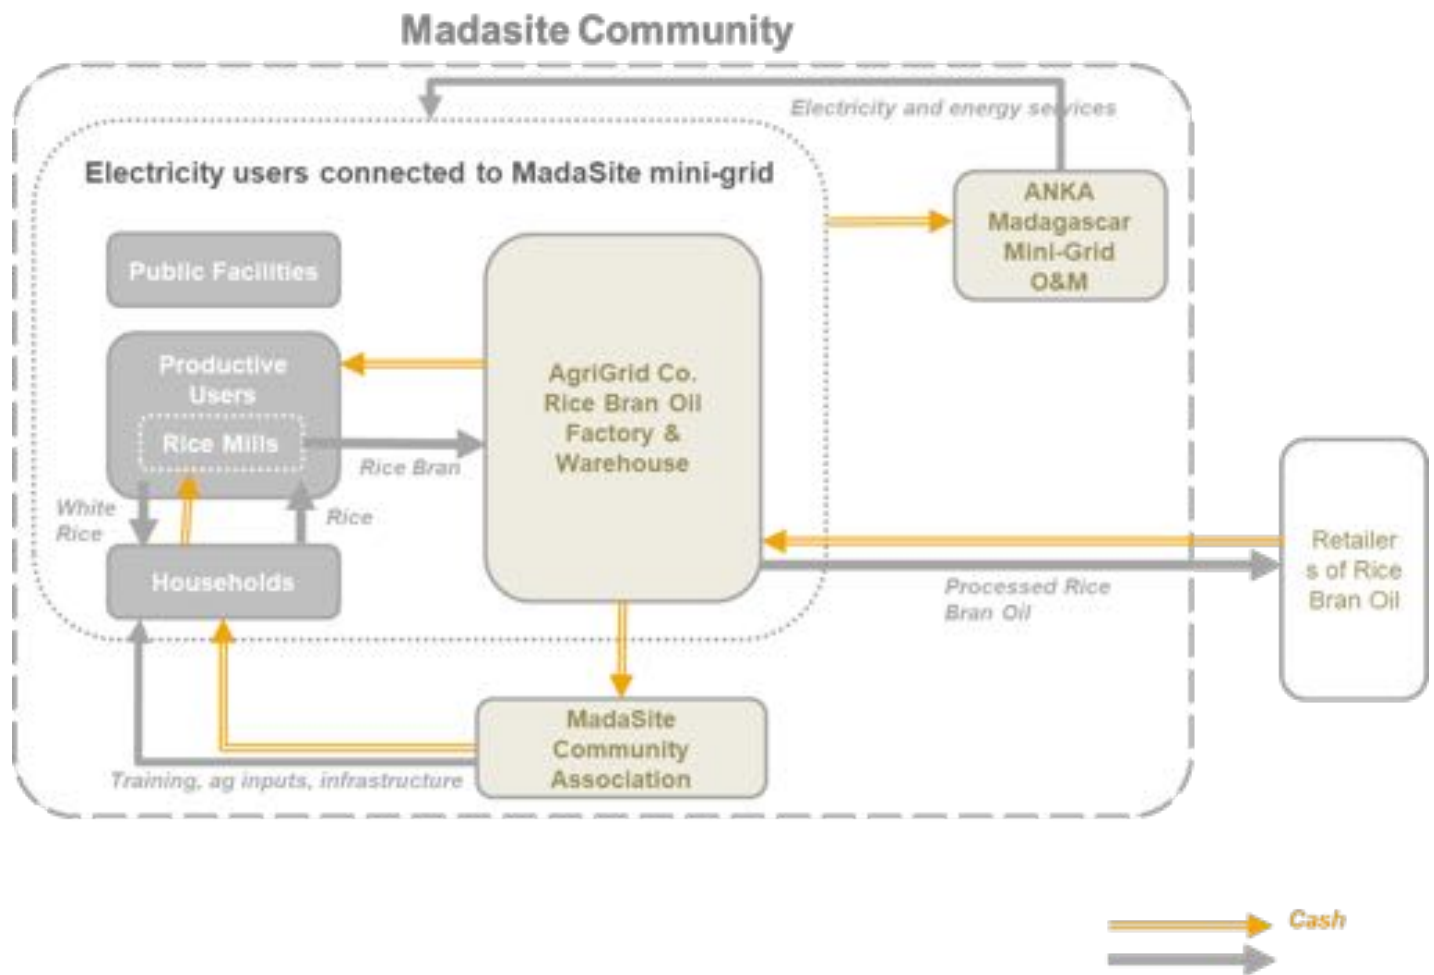

- System size not affected – simply less excess capacity
- Distribution network design not affected -lower number of household connections than Base Case
- Increase in household energy consumption ~ increase in disposable income

Rice Bran Oil

- 50% of existing bran would be available for purchase
- No bran storage, but storage for RBO
- Operations of 300 days/year
- 10% loss between bran supply and produced RBO

AgriGrid Case: Prototype project design

AgriGrid Case I: Small-scale mini-grid + RBO sales don't lead to improved financial performance

Unchanged number of productive users (apart from rice bran oil processing plant as internal consumption) but increased power production capacity

Customers

Number of phase 1 users	#	983
Number of phase 3 users	#	13

Total Generation Assets

Solar PV incl. mounting system	kWp	280
Diesel generators	kVA	230
Battery	kWh	340
PV inverter	kVA	250

Limitations of the AgriGrid Case analysis

Agricultural Modelling	<ul style="list-style-type: none">• Other, higher potential market opportunities for increasing “export revenue” likely exist. We selected the cooking oil market to illustrate here due to established demand and clear information on retail pricing.• There are several additional options for agricultural value creation in other value chains. We limited our analysis to new product development based on existing value chains.
RBO Production and Retail Marketing	<ul style="list-style-type: none">• We assumed that Malagasy households would purchase RBO as a cooking oil substitute.• RBO is not a simple oil; it involves complex processing which we simplified in our analysis.• There are several retail options which we brainstormed but did not explore. We simplified retail operations by indicating a retail price competitive with existing oils and used an industry standard profit margin.
Energy System Modelling	<ul style="list-style-type: none">• We did not materially adjust the mini-grid design between the two cases. This is likely not realistic.• Since we did not adjust energy system dimensions, we instead estimated trade-offs for # connections, consumption, and revenue.
Community and Household Modelling	<ul style="list-style-type: none">• We assumed households and rice millers would willingly sell rice bran to the AgriGrid operator in exchange for profit-sharing.• We assumed that electricity consumption would rise with increased incomes.

Comparing a mini-grid vs. AgriGrid with different sizes at MadaSite

The proposed AgriGrid project design increases development impact and investment performance but only at large scale

Performance		Mini-grid case	Small AG case	Large AG case	Deviation L-S
Average EBIT margin	%	19.1	12.1	12.6	0.5
Equity IRR	%	17.3	14.4	34.5	20.1
Equity NPV	USD	101,793	67,299	1,364,551	1,297,252
Equity payback	years	10	10	5	-5
Cumulated flow to equity	USD	1,036,323	1,240,415	6,364,811	5,144,396
Funding		Mini-grid case	Small AG case	Large AG case	Deviation L-S
Grants for assets	USD	543,089	885,238	3,701,417	2,816,179
Grants for first loss	USD	83,727	130,901	0	0
Village contribution	USD	0	0	0	0
Senior debt	USD	243,636	400,137	1,420,588	1,020,451
Equity	USD	131,188	215,458	764,932	549,474
Total	USD	1,001,640	1,631,734	5,886,937	4,255,203

Conclusions and the way forward

- **We decided not to continue with a full feasibility assessment of the RBO opportunity.** While attractive, RBO production appears technically complex, requiring sophisticated supply chains and high volumes.
- Were we to continue with the RBO value chain, **a full feasibility study would include:** consumer taste testing of RBO, an assessment of food and ag regulations, detailed sales channel research, deeper technical and operations research, and deeper supply chain research and modeling.
- **We would require an RBO technical expert and community development expert** to complete a full feasibility assessment.
- **We would further assess the governance model.** A joint venture or partnership may be preferable to a fully integrated entity.
- **Going to scale with the RBO value chain will create funding challenges.**
- Instead, we investigate other value chains that are **less complex, less challenging in terms of investment and operationalization, and more easily replicable.** A pilot is being developed for commissioning in 2021.
